

What's New NETWORK COMPOSER™, Version 6.3.3 Upgrade with Current Hardware Summary Descriptions

New Features, *Summary*:

- **New Custom Signature Enhancements**
 - Network Composer will now allow administrators to create custom signatures from the "Unknown Traffic Stats" page (Monitor/Report/Unknown Traffic Stats). By clicking the new signature icon, the Network Composer will populate all relevant information (source/destination IP, Ports, Protocol) and allow the admin to name the new signature and add it to the Network Composers library
 - Bi-directional shaping and prioritization by IP address. The Network Composer will now shape, report on, and prioritize any traffic that is flowing to and from the IP addresses placed in a custom signature
 - Administrators can now choose to isolate an entire subnet and create individual traffic signatures for that subnet only. (Doing so will not send the traffic through the Composers standard application recognition engine so a conversation with support is recommended)

- **New Report Broadcast Function Reports**
 - Network Composer has expanded the options inside of the report broadcast section to include 3 new function reports. The Human Resources report includes information such as Top Users by Browse Time, Top URL's, Top Requested Web Categories, Blocked Web Categories, and Instant Messenger Time Online. The IT Report includes a System Overview, Top Applications and Users, Possibly Infected Users, Unknown Traffic Stats, and current Application Bandwidth Settings. The Management Report includes a System Overview, Top Users and a User Browse Time report.
 - Additional categories have also been added to the Report Broadcast menu

- **VPN Pass-through Support in Firewall Mode**
 - When the Network Composer is configured in Firewall mode, it will now pass all VPN traffic protocols without any interference
 - In Bridging Mode there has never been interference

The Network Composer Version 6.3.3 release upgrade is available for download. For details on how to upgrade your firmware, visit the Cymphonix Website and download the How to Upgrade your Network Composer Firmware Document under Support/Downloads, or click here
